Clinic/Hospital Address:

GENOMIC PROFILE SUMMARY*

Molecular subtype signatures (P.2)

- ○ Neuroendocrine/small cell
- ● **Adenocarcinoma**
- ● **Luminal**
- ○ Basal
- ● **ERG**
- ○ ETS
- ○ SPINK1
- ○ TripleNeg

PREDICTIVE (P.3)

PERCENTILE RANK (%)** (0 – 100)

ADT response	99	HIGHER ADT RESPONSE
Radiation response	14	LOWER RT RESPONSE
Docetaxel sensitivity	92	HIGHER SENSITIVITY
Dasatinib sensitivity	7	AVERAGE SENSITIVITY

PROGNOSTIC (P.4)

Risk of metastasis (average of 18 signatures)*	64	AVERAGE METASTASIS RISK

TUMOR GRADE/STAGE (P.5)

Genomic Gleason grade	59	HIGHER GRADE

MOLECULAR PATHWAYS (P.5)

Tumor cell proliferation (average of 3 signatures)*	87	HIGH PROLIFERATION
AR signaling activity (average of 2 signatures)*	91	HIGH AR ACTIVITY

SELECT RNA MARKERS - TOP OUTLIERS (P.6)

		PERCENTILE RANK
RNA marker most over-expressed:	PDL3/B7H3	100%
RNA marker most under-expressed:	PDL1	1%

*RNA signatures and genes listed above are intended as a summary of the tumor profile, for which more detail is provided in the following pages. "Average of x signatures" is the average of the percentile ranks of the individual signatures.

**Percentile Rank indicates the percentage of tumor RNA profiles in the GRID (n=2,829) with lower scores than for this profile.

RESEARCH USE ONLY
The information provided in this analysis has not been clinically validated and should not be used for clinical decision-making.

SECTION 1

GRID MOLECULAR SUBTYPE SIGNATURES

The clinically heterogeneous nature of prostate cancer can be partly explained by underlying molecular heterogeneity. Prostate cancer tumors can be subtyped based on their histological appearance, cell of origin and genomic alterations. These subtypes may be important to application of hormonal and systemic therapy.

NEUROENDOCRINE/SMALL CELL SUBTYPES
Several genomic models have been developed to discriminate histologic and phenotypic variants of prostate cancer. Neuroendocrine and small cell variants tend to have poor or transient response to androgen deprivation therapy.

LUMINAL/BASAL SUBTYPE
A genomic model developed from literature-curated signatures of basal and luminal cell of origin. Prostate cancer tumors with high expression of basal genes are associated with tumor invasion, stem cell-ness, neurogenesis and inactivity of the androgen receptor signaling axis.

GENOMIC ALTERATIONS
Gene expression models developed to detect genomic alteration of the ERG and PTEN genes. ERG gene overexpression is the most common genomic alteration in prostate cancer and is highly prevalent in men of European descent but less in men of African descent. The clinical implications of ERG overexpression are unclear. PTEN deletion is common in advanced stage prostate cancer but less prevalent in localized disease. Since, PTEN is a tumor suppressor gene, low expression or it's deletion is associated with aggressive disease.

Molecular subtype signatures

- ○ Neuroendocrine/small cell
- ● **Adenocarcinoma**
- ● **Luminal**
- ○ Basal
- ● **ERG**
- ○ ETS
- ○ SPINK1
- ○ TripleNeg

SIGNATURE	TUMOR SCORE	PERCENTILE RANK (%)	TUMOR GENOMIC CLASS	PREDICTION ENDPOINT
NEUROENDOCRINE/ SMALL CELL SUBTYPE SIGNATURES				
Neuroendocrine (Kumar2016)	-0.11	9%	ADENOCARCINOMA	Adenocarcinoma vs Neuroendocrine
Small cell (Alshalalfa2016)	0.37	56%	ADENOCARCINOMA	Adenocarcinoma vs small cell carcinoma
LUMINAL/ BASAL SUBTYPE SIGNATURES				
Basal (Zhang2016)	-0.39	32%	LUMINAL-LIKE	Luminal vs Basal
GENOMIC ALTERATIONS				
ERG (Tomlins2015)	1.00	89%	ERG POSITIVE	ERG- vs ERG+
PTEN (Saal2007)	0.82	90%	PTEN-LOSS	Loss of PTEN expression

TUMOR RNA EXPRESSION PROFILE NAME:

RESEARCH USE ONLY
The information provided in this analysis has not been clinically validated and should not be used for clinical decision-making.

SECTION 2

RADIATION RESPONSE SIGNATURE

ADT RESPONSE SIGNATURE (ARS)

A gene expression signature derived from a panel of neuroendocrine (NE) genes has been developed to predict treatment failure from adjuvant androgen deprivation therapy (ADT) after radical prostatectomy. Patients with high ARS scores have been shown to have improved response to ADT (lower metastasis rate) whereas patients with low ARS scores have been shown to more rapidly fail adjuvant ADT (higher metastasis rate). This signature requires prospective validation.

RADIATION THERAPY RESPONSE (RTR)

A gene expression signature derived from a panel of DNA repair genes has been developed to predict treatment failure from radiation therapy (RT) after radical prostatectomy. Patients with high RTR scores have been shown to have improved response to RT (lower metastasis rate) whereas patients with low RTR scores have been shown to have lower response to RT (higher metastasis rate). This signature requires prospective validation.

DRUG RESPONSE SCORES (DRS)

Gene expression signatures were derived from in vitro screening of drugs in 60 pan-cancer tumor cell lines. A drug response score (DRS) is developed based on the expression profile for cell lines sensitive to a particular drug. Patients with high DRS (e.g. percentile rank > 90%) are predicted to be sensitive, whereas patients with low DRS (e.g. percentile rank < 10%) are predicted to be less sensitive to the drug. DRS is for research use only and has not been validated in human clinical trials.

SIGNATURE	TUMOR SCORE	PERCENTILE RANK (%)	PREDICTED RESPONSE	ENDPOINT DESCRIPTION
ADT RESPONSE SIGNATURE				
ADT Response (Karnes2016)	0.96	99%	HIGHER ADT RESPONSE	Response to adjuvant androgen deprivation therapy
RADIATION RESPONSE SIGNATURE				
RT Response (Zhao2016)	-1.23	14%	LOWER RT RESPONSE	Response to postoperative radiation
DRUG RESPONSE SIGNATURES				
Docetaxel (Lehrer2016)	0.31	92%	HIGHER SENSITIVITY	Sensitivity to docetaxel*
Dasatanib (Lehrer2016)	-0.26	7%	AVERAGE SENSITIVITY	Sensitivity to dasatinib*

*Based on similarity to expression profiles of sensitive and insensitive *in vitro* cancer cell lines.

RESEARCH USE ONLY
The information provided in this analysis has not been clinically validated and should not be used for clinical decision-making.

SECTION 3

GRID PROGNOSTIC SIGNATURES

Several gene expression signatures have been developed to predict adverse pathology, biochemical recurrence, metastasis and prostate cancer-specific mortality. We have retrained these signatures to predict prostate cancer metastasis in 1,574 patients from a multi-institutional cohort (Karnes 2013, Den 2014, Klein 2014, Ross, 2015). The signatures are ranked ordered by their area-under-the curve values for predicting metastasis under cross-validation. Patients with higher scores for the majority of these signatures are at greater risk of developing metastatic disease. Patients with lower scores for the majority of these signatures have a lower risk of metastasis.

Prognostic

Risk of metastasis* — 0 — PERCENTILE RANK (%) — 100 — 64 — AVERAGE METASTASIS RISK

SIGNATURE	INSTITUTION NAME	TUMOR SCORE	PERCENTILE RANK (%)	METASTATIC RISK
Wu 2013	Massachusetts General Hospital	0.53	73%	AVERAGE
Bismar 2006	Dana Farber Cancer Institute	0.69	92%	HIGHER
Penney 2011	Dana Farber Cancer Institute	0.24	45%	LOWER
Agell 2012	Hospital del Mar-Mar Health Park	0.20	16%	LOWER
Ramaswamy 2003	Dana Farber Cancer Institute	0.37	60%	LOWER
Varambally 2005	University of Michigan	0.60	86%	AVERAGE
Bibikova 2007	UC San Diego	0.35	59%	LOWER
Talantov 2010	Garvin Institute	0.34	72%	LOWER
Nakagawa 2008	Mayo Clinic	0.23	23%	LOWER
Stephenson 2005	Memorial Sloan Kettering Cancer Center	0.32	83%	LOWER
Lapointe 2004	Johns Hopkins	0.24	48%	LOWER
Yu 2007	University of Michigan	0.41	76%	AVERAGE
Long 2011	Emory University	0.53	91%	AVERAGE
Long 2014	Emory University	0.22	87%	HIGHER
Singh 2002	Dana Farber Cancer Institute	0.51	62%	AVERAGE
Klein 2014	Cleveland Clinic	0.39	77%	LOWER
Cuzick 2011	King's College	0.60	85%	HIGHER
Larkin 2012	Queen Alexandria Hospital	0.44	92%	AVERAGE

TUMOR RNA EXPRESSION PROFILE NAME:

RESEARCH USE ONLY
The information provided in this analysis has not been clinically validated and should not be used for clinical decision-making.

SECTION 4

TUMOR GRADING/STAGING GENOMIC MODELS

Several genomic signatures have been developed to predict adverse pathology such as high Gleason grade and tumor stage. At needle biopsy, these signatures may be useful in addition to prognostic scores for improved staging of the tumor. Patients with high scores may harbor aggressive prostate cancer and a second line of treatment may be recommended, while patients with low scores across all signatures may be suitable candidates for active surveillance.

Tumor Grade/Stage

SIGNATURE	TUMOR SCORE	PERCENTILE RANK (%)	TUMOR CLASS	PREDICTION ENDPOINT
Genomic Gleason (Abdollah)	0.80	59%	HIGHER GRADE	Primary pattern 4 or 5 at RP
Genomic Gleason (Penney2011)	0.99	76%	HIGHER GRADE	Primary pattern 4 or 5 at RP
Genomic CAPRA-S (Abdollah2016)	0.93	83%	HIGHER GRADE/STAGE	High CAPRA-S (>5) score
pT3 Disease (Abdollah2016)	0.87	89%	NON-ORGAN CONFINED	Pathologic stage T3

SECTION 5

MOLECULAR PATHWAYS

A hallmark of cancer cells is their loss of cell cycle control, which enables uncontrolled proliferation and growth. Highly correlated cell cycle progression genes have been used to provide a robust measurement of cell proliferation (Cuzick 2011). Tumors with high expression of proliferation genes are associated with biochemical recurrence and a worse prognosis after radical prostatectomy but may also be more sensitive to anti-mitotic chemotherapy. Androgen Receptor (AR) signaling is a key regulator of prostate tumor development where tumors with very low or very high AR signaling have poor prognosis and may be insensitive to hormonal suppression (Kumar 2016).

Molecular pathways

SIGNATURE	TUMOR SCORE	PERCENTILE RANK (%)	PREDICTED CLASS	PREDICTION ENDPOINT
Proliferation (Cheville2007)	0.52	81%	AVERAGE PROLIFERATION	Tumor cell proliferation
Proliferation (Cuzick2011)	0.06	87%	AVERAGE PROLIFERATION	Tumor cell proliferation
Proliferation (Glinsky2005)	0.64	93%	HIGHER PROLIFERATION	Tumor cell proliferation
AR Activity (Faisal2015)	15.92	91%	AVERAGE AR ACTIVITY	Expression of AR-dependent genes
AR Activity (Kumar2016)	1.31	91%	AVERAGE AR ACTIVITY	Expression of AR-dependent genes

TUMOR RNA EXPRESSION PROFILE NAME:

RESEARCH USE ONLY

The information provided in this analysis has not been clinically validated and should not be used for clinical decision-making.

SECTION 6

SELECT RNA MARKERS

Decipher GRID contains RNA expression values covering approximately 46,000 coding and non-coding genes. The list below represents genes currently evaluated for their prognostic & predictive power in prostate cancer. GRID will be updated as new markers are studied and evaluated. High and low expression of PCA3 are defined by segmenting a bimodal distribution. For all other markers, high and low outliers are defined by 2.2 median absolute deviations greater or lower than the median of the reference GRID population (n=2,829). A full list of the 36 genes in this profile, relevant research findings and references are updated regularly on www.DecipherGRID.com.

		PERCENTILE RANK (%)	TUMOR SCORE	OUTLIER STATUS*
ANDROGEN SIGNALING	AR	78%	0.90	-
	KLK2	70%	4.34	-
	KLK3	62%	4.41	-
	PCA3	26%	1.08	LOW
	NKX3-1	97%	1.60	-
	SRD5A1	54%	0.31	-
NEUROENDOCRINE/SMALL-CELL	pRB1	67%	0.74	-
	CCND1	97%	1.39	-
	CHGA	30%	-0.25	-
	AURKA	8%	-0.26	-
	NEAT1	93%	4.44	-
	MYCN	20%	-0.19	-
PROLIFERATION/GROWTH	Ki67	90%	0.12	-
	TOP2A	83%	0.15	-
	EGFR	49%	0.43	-
	HER2/NEU	89%	0.75	-
	ERBB3	85%	1.04	-
	c-MET	11%	-0.01	-
DNA REPAIR	ATM	43%	0.47	-
	ATR	83%	0.57	-
	RAD21	25%	0.90	-
	DNAPK	52%	0.62	-
	NBN	30%	0.61	-
	PARP1	83%	0.41	-
INVASION/ANGIOGENESIS	SChLAP1	90%	1.86	HIGH
	EZH2	70%	0.02	-
	SPARCL1	27%	1.86	-
	GSTP1	36%	0.30	-
	VEGFR2	16%	-0.01	-
	HIF1A	55%	1.24	-
IMMUNO-ONCOLOGY	PD1	39%	0.49	-
	PDL1	1%	-0.38	LOW
	PDL2	5%	-0.13	-
	PDL3/B7H3	100%	1.43	HIGH
	CTLA4	61%	0.04	-
	IDO1	19%	-0.13	-

*Outlier status is based on the expression level of each individual gene relative to the total patient population (2,829). Therefore, this is not an absolute value, but rather a comparative level of expression based on the normal distribution observed for that gene marker.
